

POF equations aide memoire

Continuity and Bernoulli

$$A_1 V_1 \rho_1 = A_2 V_2 \rho_2 = A_3 V_3 \rho_3$$

$$P_t = P_s + q$$

Lift equations

$$L = \frac{1}{2} \rho V^2 S C_L \quad \text{or} \quad L = q S C_L \quad \text{or} \quad L \propto IAS^2 S C_L$$

$$\text{In S\&L with a wing of constant area} \quad IAS_1^2 C_{L1} = IAS_2^2 C_{L2}$$

$$\text{Stall speed (new)} = \text{Stall speed (old)} \times \sqrt{(\text{weight new} / \text{weight old})}$$

$$\text{Load factor} = \text{lift} / \text{weight}$$

Or use three step process between 2 pairs of variables eg V_s and LF :

Step 1 Will answer be larger or smaller (determines respectively if larger or smaller number on top in ratio in step 2)

Step 2 Write equation

$$\text{eg. } V_{s \text{ new}} = V_{s \text{ old}} \times \text{LF new} / \text{LF old}$$

Step 3

Part 1 - Is speed a variable? Y/N

Y = Go to part 2

N = Ignore Step 3

Part 2 - Is the speed change known? Y/N

Y = Square the ratio of speeds i.e. $(V_{\text{new}} / V_{\text{old}})^2$

N = Square root the ratio i.e. $\sqrt{\text{LF new} / \text{LF old}}$

Drag equations

$$D = \frac{1}{2} \rho V^2 S C_D \quad \text{or} \quad D = q S C_D \quad \text{or} \quad L \propto IAS^2 S C_D$$

Parasite drag $\propto V^2$

Induced drag $\propto 1/V^2$

$$C_{Di} \propto C_L^2 / \text{Aspect ratio}$$

Drag is proportional to weight at V_{MD} only, so at V_{MD} $W_1/W_2 = D_1/D_2$

Aeroplane descriptions

Aspect ratio = span/chord or $\text{span}^2/\text{area}$ (larger than 1)

Taper ratio = tip chord/root chord (smaller than 1)

Climbing

$$L = W \cos \alpha, \text{ and } L/F \text{ is less than } 1$$

$$T = D + W \sin \alpha \quad \text{or} \quad \sin \alpha = (T-D)/W$$

At small angles of climb $\sin \alpha$ almost equals $\tan \alpha$ and therefore,

$$\% \text{ gradient} = (T-D)/W \times 100$$

Descending

$$L = W \cos \alpha, \text{ and } L/F \text{ is less than } 1$$

$$D = T + W \sin \alpha \quad \text{or} \quad \sin \alpha = (D-T)/W$$

$$\% \text{ gradient} = (D-T)/W \times 100$$

Gliding

$$\% \text{ gradient} = D/W \times 100$$

$$\text{gradient} = D/L \text{ therefore, Glide range} = \text{Height} \times L/D \text{ ratio}$$

Turning

Remember V must be in m/s (multiply by 0.5144 or halve it will do to get knots)

$$LF = 1 / \cos \phi$$

$$\text{Radius} = V^2 / g \tan \phi \quad (\text{multiply by 2 for Diameter!})$$

$$\text{Rate of turn} = \text{TAS} / \text{Radius} \quad (\text{multiply by 57.3, 60 will do to get } ^\circ/\text{sec})$$

$$\begin{array}{ll} \text{Rate 1 turn} = 3^\circ/\text{sec} & \phi \text{ for rate 1 turn} = \text{TAS} / 10 + 7 \\ (\text{TAS is in kts for this}) & \end{array}$$

High Speed Flight

$$\text{Local speed of sound (LSS or 'a')} = 39 \sqrt{K}$$

$$\text{Mach number} = \text{TAS} / \text{LSS}$$

$$\text{Mach cone angle} - \sin \mu = 1 / \text{Mach number}$$

Stability

$$\text{Stick force per g} = \text{stick force} / \text{change in LF from 1 g}$$

Limitations

$$V_A \text{ new} = V_A \text{ old} \sqrt{(\text{weight new} / \text{weight old})}$$

Gust Load Factor (GLF) is about the change in LF away from 1g and is proportional to speed

Use the first 2 steps in the '3 Step' method but remember to remove 1g from all load factors used, and once calculated add 1g back on to find actual GLF
